

Dmytro Varchuk

FULLSTACK TEAM LEAD

Engineering Lead, Sr Node.js | Full-Stack Engineer with 5+ years of experience in backend and full-stack development, architecture, and team leadership. Specialized in building high-load, scalable systems with Node.js, TypeScript, NestJS, AWS, React, and microservices. Experienced in leading international engineering teams of up to 11 developers, driving architecture decisions, improving development processes, and mentoring engineers. Focused on backend architecture, cloud infrastructure, distributed systems, and engineering leadership

Work Experience

ZOOP

Senior Back-end developer

Jan 2026 - Present

High-load digital platform with media processing, real-time functionality, AI content moderation, and infrastructure designed for multi-million-user traffic spikes.

- Migrating the backend from legacy Node.js/Lambda serverless architecture to NestJS and ECS Fargate
- Designing SQS-based asynchronous processing pipelines
- Building scalable video processing with AWS MediaConvert
- Integrating AI-based content moderation
- Designing backend architecture for high-load and peak-traffic scenarios
- Supporting real-time communication and scalable cloud infrastructure

Key Contributions:

- Migrated ~100 legacy Lambda functions to a NestJS + ECS Fargate backend domain by domain under live traffic, with zero downtime and no feature freeze
- Cut p95 latency on heavy endpoints by ~35% and eliminated ~2s cold starts by moving compute from Lambda to long-running ECS tasks
- Designed an SQS-driven video pipeline on AWS MediaConvert handling ~10K uploads/day with an explicit processing state machine, retries and idempotent consumers — decreased duplicate and failed renders by ~90%
- Scaled the platform through Eurovision-scale traffic — absorbed a ~8x spike over baseline with zero incidents, autoscaling ECS from ~10 to ~80 tasks with SQS queues acting as a load damper
- Integrated asynchronous AI content moderation across 100% of uploads — decreased publish-flow latency by ~4s by moving the check off the user's critical path
- Optimized hot paths and PostgreSQL query patterns exposed under peak load — reduced database read load by ~40% and ECS compute cost by ~25%

Tech Stack: Node.js, NestJS, REST, React, React Native, AWS Lambda, ECS Fargate, SQS, S3, CodePipeline, MediaConvert, WebSockets

Finsfera

Full-Stack Team Lead

Feb 2023 - Mar 2025

High-load cryptocurrency platform providing real-time and historical market price data.

- Developed backend services for cryptocurrency market data
- Implemented live price streaming via WebSockets
- Built storage and retrieval flows for historical price data across multiple timeframes
- Implemented multi-regional deployment
- Designed client routing to the fastest-responding regional server
- Contributed to frontend integration and AWS-based infrastructure

Key Contributions:

- Built a WebSocket price-streaming layer delivering live quotes for ~400+ trading pairs to ~5K concurrent connections at sub-100ms end-to-end latency
- Engineered historical price storage and retrieval across 10+ timeframes (1m → 1d), serving candle queries over ~5M records in under 300ms

Skills

Programming

Languages/Technologies

- Javascript, Typescript
- HTML, CSS
- Git

Back-End:

- Node.js
- Express.js
- NestJS
- AdonisJS
- Loopback
- GraphQL
- REST
- WebSockets
- Sequelize
- TypeOrm
- CDS

Front-End:

- React.js
- Vue.js
- Redux
- Next.js
- Vuexy
- MUI
- AntDesign
- Bootstrap
- Storybook

Databases:

- MySQL
- Postgres
- Sqlite
- MongoDB
- Redis
- RedisGraph

DevOps/Cloud:

- Docker
- GitHub Actions
- Jenkins
- DigitalOcean
- Gcloud services
- S3
- SQS
- Cloud SQL
- Logging
- Firebase
- Kubernetes (basic)
- n8n

- Implemented multiregional deployment across 5 regions with latency-based client routing to the fastest-responding server — decreased median connection latency by ~40% for non-EU users
- Optimized the WebSocket payload with delta updates and batching — reduced outbound bandwidth by ~35% and client-side render load accordingly
- Increased feed uptime to ~99% by adding reconnect-with-backfill logic, so clients recover missed ticks instead of showing stale prices

Tech Stack: Node.js, Express.js, REST, React, AWS, WebSockets

E-Logic

Full-Stack Team Lead

Mar 2022 - Oct 2022

CRM / Logistics SaaS and credit product with payment integrations, transactional workflows, and role-based access management.

- Led a development team of 11 engineers
- Designed core system architecture and database structure
- Developed transactional and payment processing flows
- Integrated payment providers and CRM systems
- Designed role-based permissions and access control
- Coordinated payment status processing using pull and callback mechanisms
- Introduced sprint planning, grooming, documentation processes, and L2 support structure
- Supported engineering delivery and team processes

Tech Stack: Node.js, NestJS, AdonisJS, React, Firebase, Google Cloud, Stripe

SAP

Full-Stack Developer

Aug 2019 - Feb 2022

Enterprise insurance and SAP solutions, including policy management systems, SAP interfaces, and analytical dashboards.

- Developed insurance policy systems for a UK-based client
- Worked across backend and frontend development
- Built APIs and user interfaces for SAP-related solutions
- Developed analytical dashboards
- Designed and maintained database schemas
- Developed middleware and integration components
- Worked with containerized infrastructure and Kubernetes

Tech Stack: Node.js, LoopBack, Vue.js, React, Redux, CDS, Docker, Kubernetes

3party:

- Payments: Stripe,Platon, LiqPay, EasyPay, City24, PUMB API, Nayax
- Sms: Turbosms, Alphasms
- Chatwoot, Infobip
- Webitel
- Novu
- Sftpsservers

Methodologies/Practice:

- Agile,Scrum, Kanban
- TestDriven, Feature Driven Infrastructure
- L2 Support
- PR Review, Deploy system
- Mentorship
